

## Vaughan Telehandler Certification

Vaughan Telehandler Certification - Telehandler certification programs are both for operators who have some experience driving a typical forklift and for people with no experience. The real-world training offered by these programs produces graduates who know the safe and proper use of these kinds of equipment.

Telehandler certification courses are offered in two forms: at a training facility; at the trainee's job site. With the former option, the manufacturer could work with a licensing agency to bring people to a training facility. This option offers those training with the chance to learn to utilize the equipment in a controlled setting. Upon completion, people who participated receive a license or certification to use this type of machinery.

When the training is carried out on the worksite, a skilled instructor is sent to the work location. This is the best way to make sure that your workers receive particular training on the equipment which they will be working with, helping to train the trainee in their own work setting. Those training learn about possible dangerous situations that could happen on the actual work location. The instruction focuses on any circumstances that are specific to the work location, enabling operators to be ready to safely handle these elements.

"Telehandler" is an abbreviated version of the term "telescopic handler," that references the equipment's extending or telescoping arm supporting a fork. The controls and characteristics of the telehandler are quite similar to a lift truck. A telehandler has the capability of lifting and transporting loads up and away from the vehicle. Wrong utilization of telehandlers can result in serious accidents. If load limits are exceeded, the machine could tip due to excess weight on the lift. It is an operator's task to understand load limits and to safely make use of these machinery.

"Conversion" classes are designed for operators who have been certified to use a forklift. These conversion classes would teach the differences between the operation of a forklift and a telehandler, all the while trying to avoid repetitive information which the forklift operator is already familiar with. For trainees who have no prior experience utilizing telehandler equipment, training includes the basic operation and utilization of the machine. Some groups provide refresher programs as well.
