Vaughan Manlift Training

Vaughan Manlift Training - Various manlift training programs include the content and review of manlift devices. An important part of the program is the practicum where students demonstrate their practical ability and knowledge to safely operate a manlift. A requirement to Manlift training is the fall protection training, which may be included in the training according to the particular requirements of the customer.

Course Content

The course content includes: pre-shift equipment check and work area survey requirements; the impact of performing unsafe acts or operating unsafe equipment, Review of load capacities, Lifting devise equipment definitions, safety decals and particular machine requirements, Review of related parts of the OSHA Standards and the CSA Standards and Review site specific Hazards, together with controls for safe use of a lifting device.

Demonstration and Evaluation Content

The evaluation and demonstration portion of the course includes: Using a spotter or a signaler when required; Proper personal protective equipment or also referred to as P.P.E. as required; Utilizing a lift just on solid and level ground; Using the proper fitting harness or fall arrest device; Utilizing the lift with all other workers clear of the job site; Aware of load limits etc. and other specs as set out by the manufacturer; Pre-shift work area survey and machine inspection; Having all associated machines stored safely on the lift platform; Ensuring a safe and smooth operating speed for various plant conditions and isolating off the work place when major work projects are to be done.

Each of the trainees would undergo testing to make certain that they are able to safely operate their machine.

Manlift Safety

Manlifts could be really dangerous machines as they are capable of lifting a worker 20 feet or higher in the air and that creates a particular amount of risk. Since the danger is so apparent, lift operators and owners are careful to correctly maintain their equipment and follow correct operating procedures and safety measures. The ratio of accidents involving this particular machine is rather low.

The safe use of the boom lift, scissor lift and the manlift is up to the operator of that machinery. They need to understand all of the responsibilities that go with running the machinery and how to use the lift vehicle safely. The most basic safety features on the machine are the operating handbook and safety decals. These show vital information about the safety machines, maintenance and operating procedures.

Newer lift models will come together with instruction manuals and decals in place. Technically, the operating guidebook must be kept on the lift itself. If you are buying a used lift, it is important to ensure that the instruction manual is included and that important decals haven't been painted over. The restraints that prevent operators from falling and the guardrails are other essential safety features. These are standard and mandatory on all kinds of lifts.
